Catalog of Meteorological Satellite Data

ESSA 1 Television Cloud Photography

Part 2

April 1 - October 6, 1966

NOV 2 9 1966

PURPOSE

The Key to Meteorological Records Documentation Series has been established to provide guidance information to research personnel making use of climatological data.

Frequently users of such data have found it necessary to spend a great deal of time establishing whether the criteria for observing or computing various elements have changed over the period of record or in what form the data are available.

It is therefore hoped that the presentation of this series may not only conserve valuable time but may have a direct influence in improving the accuracy of research results.

PREFACE

This issue in the series of catalogs describing the television cloud photographs obtained by the ESSA 1 meteorological satellite covers the period of April 1, 1966 through October 6, 1966. The maps and listings generally follow the pattern established in the "Catalog of Meteorological Satellite Data - TIROS I Television Cloud Photography," published as No. 5.31 in the Environmental Data Service Series *Key to Meteorological Records Documentation*.

Documentation Section
National Environmental Satellite Center

USING THE CATALOG

1. Scan the cloud maps for dates and areas of interest.
2. When a picture of interest is located, the film can be ordered by date from the National Weather Records Center, Asheville, N. C., at a cost of $8.50 per day.
3. Information for a particular pass, such as the time interval between frames, actual picture taking pass number and number of usable frames, may be determined by using the tabulated listings preceding the composite nephanalyses.

CATALOG OF METEOROLOGICAL SATELLITE DATA
ESSA 1 Television Cloud Photography
PART 2 - April 1 through October 6, 1966

The ESSA 1 meteorological satellite, a twin of TIROS IX and the first satellite in the TOS system, was launched by the National Aeronautics and Space Administration on February 3, 1966. ESSA 1 was put into a near-polar near-circular orbit with an apogee of 521 statute miles and a perigee of 434 statute miles. Its orbital period was 100.22 minutes which corresponded to slightly more than 14 passes around the earth each day. The orbit was inclined at an angle of 97.9° (82.1° retrograde) to the earth's equatorial plane. ESSA 1 was almost sun-synchronous and could view virtually the entire earth, passing over a given area in the early afternoon each day. However, because it was not in a perfect sun-synchronous orbit, the time at which ESSA 1 viewed a given portion of the earth was about 15 seconds earlier each day.

ESSA 1 was a standard TIROS satellite modified to a "cartwheel" configuration to obtain earth-oriented picture coverage. Like previous TIROS satellites, it was spin-stabilized, spinning about its axis at a rate that varied between 8 and 12 rpm. However, once the satellite was in orbit, it was maneuvered so that the spin axis was aligned perpendicularly to the orbital plane. Thus, in its final orbital attitude, ESSA 1 rolled along its orbit on its side like a wheel.

Its two cameras, each of which had a wide-angle lens, were mounted 180° apart and viewed out through the cylindrical side of the spacecraft. By detecting the passage of the horizons with an IR (infrared) sensor during each rotation of the satellite, the cameras were triggered to take pictures when pointed downward. In order to eliminate picture gap between adjacent passes, each camera was tilted at an angle of 26-1/2° to the plane of rotation, one to the left and the other to the right. As the satellite spun, pictures obtained by the two cameras overlapped directly beneath the satellite and also had sufficient width perpendicular to the orbital track to overlap pictures taken on the next earlier and later passes.

Camera action aboard ESSA 1 was controlled from two Command-and-Data-Acquisition (CDA) stations: one located at Wallops Station near Chincoteague, Virginia and the other at Gilmore Creek, Fairbanks, Alaska. The satellite came within radio range of one or both of these stations for a few minutes each on all except 3 of its 14 to 15 daily passes. The 3 passes in which the satellite did not come within radio range of a CDA station occurred in consecutive order over the Pacific and, combined with the limitation of the tape recorder in the satellite, reduced the amount of photographic coverage in the South Pacific area. While the satellite was in radio contact with the CDA station, the station could:

1. if it was daytime, receive a series of television pictures directly as they were taken;

2. command the system to take pictures remote from the CDA station after a specified time delay and store them on tape aboard the satellite;

3. play back one previously commanded tape sequence from each camera.

Tape pictures were obtained in sequences up to 48 frames each. Direct sequences were usually shorter and more variable in length. The time interval between frames was 30 seconds in most direct sequences, and was either 32, 64, or 128 seconds in tape sequence.

The pictures are virtually square with some small distortion resulting from the particular setting of the electronic readout equipment. "Fiducial marks" etched on the face of the vidicon tube appear in the picture image as a central cross and four L-shaped corners, although they may show poorly or not at all against a dark background. For each camera, the principal point (i.e., the intersection of the optical axis of the camera with the image plane) is at the intersection of the two lines that form the central cross mark.

Cloud picture transmissions received at CDA stations were displayed on a television screen and simultaneously recorded on magnetic tape. A 35 mm. camera photographed the television screen, including also a lighted panel board mounted underneath. The panel board information provides a legend for each picture including camera number, mode (TAPE or DIRECT), frame number, orbital pass number, and station initial preceded by "I" for ESSA 1 with ESSA underneath.

In the example of figure 1, the legend indicates the picture was received and taken on orbital pass number 100 and that it is a TAPE picture taken by camera 1. The letter "W" at right center following the number "I" indicates the picture was acquired at Wallops Station.

The panel board legend also contains a series of numerals whose sum indicates the frame number. In figure 1, the frame number is 36, representing the sum of 4 and 32. Within each sequence, the indicated frame numbers increase in the order that the pictures were received at the CDA station. For direct mode this is the time order in which the pictures were taken. But tape sequences were played back to the station in reverse time order. Pictures of both modes are arranged on the film in order of increasing frame number; therefore it is important to note that this arrangement is correct time order for direct sequences, but is reverse time order for tapes.

The orderly time sequence of pictures is sometimes interrupted by spurious noise frames or complicated by skipped frames. In such cases, the frame numbers are not a dependable indicator of real picture counts.

For ESSA 1 the new system of "Tracks" is used to identify the general geographic areas over which picture sequences were taken. These tracks are shown on the locator map (fig. 2) and track table 7 which appears in this catalog immediately following the tabulated listings. The track boundaries are parallel to the path followed by the subsatellite point during the daylight portion of each orbital pass. The width of each track is exactly equal to the amount the earth rotates between consecutive passes. Thus, in general, the satellite subpoint will make one traverse along each track each day (from midnight to midnight, GMT). The track boundaries are fixed permanently for the life of ESSA 1 and are arbitrarily referenced to the point 0° latitude, 0° longitude, with track numbers increasing westward.

Since the ESSA 1 orbital period of 100.22 minutes is not an exact submultiple of 24 hours, the satellite starts 14 passes on most days and 15 on about every third day. This results in Track 15 being much narrower than the others and, thus, it is not traversed every day. There are also days on which one particular track is traversed just after GMT midnight, and again later the same day just before GMT midnight. On these occasions, the second traverse is designated by the track number followed by the letter A. For example, if the track traversed twice in a day were 6, the first traverse would be 6 and the second 6A. There would, in this case, be a corresponding day without a traverse of Track 6. Assignment of Track 6 to one day or another is determined by the GMT time at which the subsatellite point crossed the equator near the midpoint of the track.

On the film reels, picture sequences are grouped together by track number and assembled in chronological order. Track numbers are stamped on the film immediately preceding the sequences to which they apply.

The following pages of maps and tabulated listings give descriptive information about the pictures obtained by ESSA 1. In the listings each picture sequence is described by one line, and the sequences are grouped together by date and track number. This is the order in which they appear on the film reel. The column headings and entries have the following meanings:

DATE: For tape (remote) sequences - Month and day of the daylight equator crossing of the satellite subpoint.

For direct sequences - month and day of the midpoint time of the sequence.

Figure 1 - Example of ESSA I Cloud Photography

TRACK: Defines the geographic area which contains the path of the subsatellite point. The entries refer to the numbered areas outlined on the first map in this catalogue.

TIME: Approximate time in hours and minutes
(a) For tape sequences - daylight equator crossing
(b) For direct sequences - midpoint time of the sequence

FILM LEGEND: This section gives the information actually appearing on the film in the panel board legend accompanying each picture.

PASS: Orbital pass number on which the pictures were read out, as indicated in the upper right corner of the legend.

M: Mode of transmission indicated in the legend.

D = Direct
T = Tape

C: Camera number indicated in the legend.

1 = Camera number one
2 = Camera number two

S: CDA station which received the sequence.

W = Wallops Station, Va.
F = Fairbanks, Alaska

P/T PASS: Orbital pass number on which the pictures were taken. On the composite maps in this catalog, this number appears beneath the nephanalysis for the picture sequence.

FRAME:
TI: Time interval, in seconds, between frames.
V: Indicates time interval varies within the sequence.
US: Number of usable frames in the sequence.

Following the listings is a series of maps which shows the area covered by each sequence having usable frames and for which picture taking time has been determined. Most of the picture sequences were analyzed for their cloud content during routine operations and these nephanalyses have been reproduced on the maps. Each nephanalysis is identified with the date and track number (preceded by a "T") and the equator crossing number that occurred during the nephanalysis. Satellite attitude and exposure time are not always accurately known at the time the nephanalyses are constructed. However, most of the nephanalyses are considered to be geographically accurate to about ± 2° with a few ranging from ± 1° to ± 5°. Users are cautioned not to attribute any greater accuracy to the location of cloud patterns shown.

The symbols used in the nephanalyses are defined by the following legend:

	CUMULOFORM CLOUD		STRATIFORM CLOUD
	CIRROFORM CLOUD		APPARENT CUGG OR CB
	BOUNDARY OF MAJOR CLOUD SYSTEMS - FRONTS, VORTICES, OR OTHER SYSTEM DOMINATING THE SCENE VIEWED BY THE SATELLITE

NOTE: STIPPLING WILL BE USED TO EMPHASIZE THE AREAS CONSIDERED BY THE ANALYST TO BE OF GREATEST SYNOPTIC SIGNIFICANCE.

The ESSA 1 master films are deposited at the National Weather Records Center (NWRC), Environmental Science Services Administration, Federal Building, Asheville, North Carolina 28801. Persons or institutions desiring copies may order them from the NWRC in the form of 35 mm. positive transparencies for projection or 35 mm. duplication negatives from which opaque prints can be made. The pictures should be ordered by date at a cost of $8.50 per day. All copies will be furnished with sprocket holes since the necessary film emulsion is available only in this form.

Available also from the NWRC, for the cost of reproduction, are reels of microfilmed nephanalysis charts from TIROS I thru ESSA 1.
